UNIVERSITY OF MINNESOTA ROCHESTER

President's Council of Advisors on Science and Technology (PCAST) 2010:

instructors during the first two years of college must focus on deeper and transferable knowledge

Quoting the NRC “Framework for Science Education”:

“Analyzing and interpreting data”, “engaging in argumentation from evidence”, and “evaluating information” can all be seen as distinct components of critical thinking. **J. Chem. Educ. 2016, 93, 799–800**

P. Atkins. Pure Appl. Chem., Vol. 71, No. 6, pp. 927-929, 1999.

“...we should teach them to judge between conflicting influences. That is the essence of our subject, for it is rare that a single property governs the outcome of a reaction. We need to train our students to judge the likely outcome of conflict”

“...I assume there are exceptions to this rule because there is an exception to pretty much every rule in chemistry.” **Gen Chem student.**

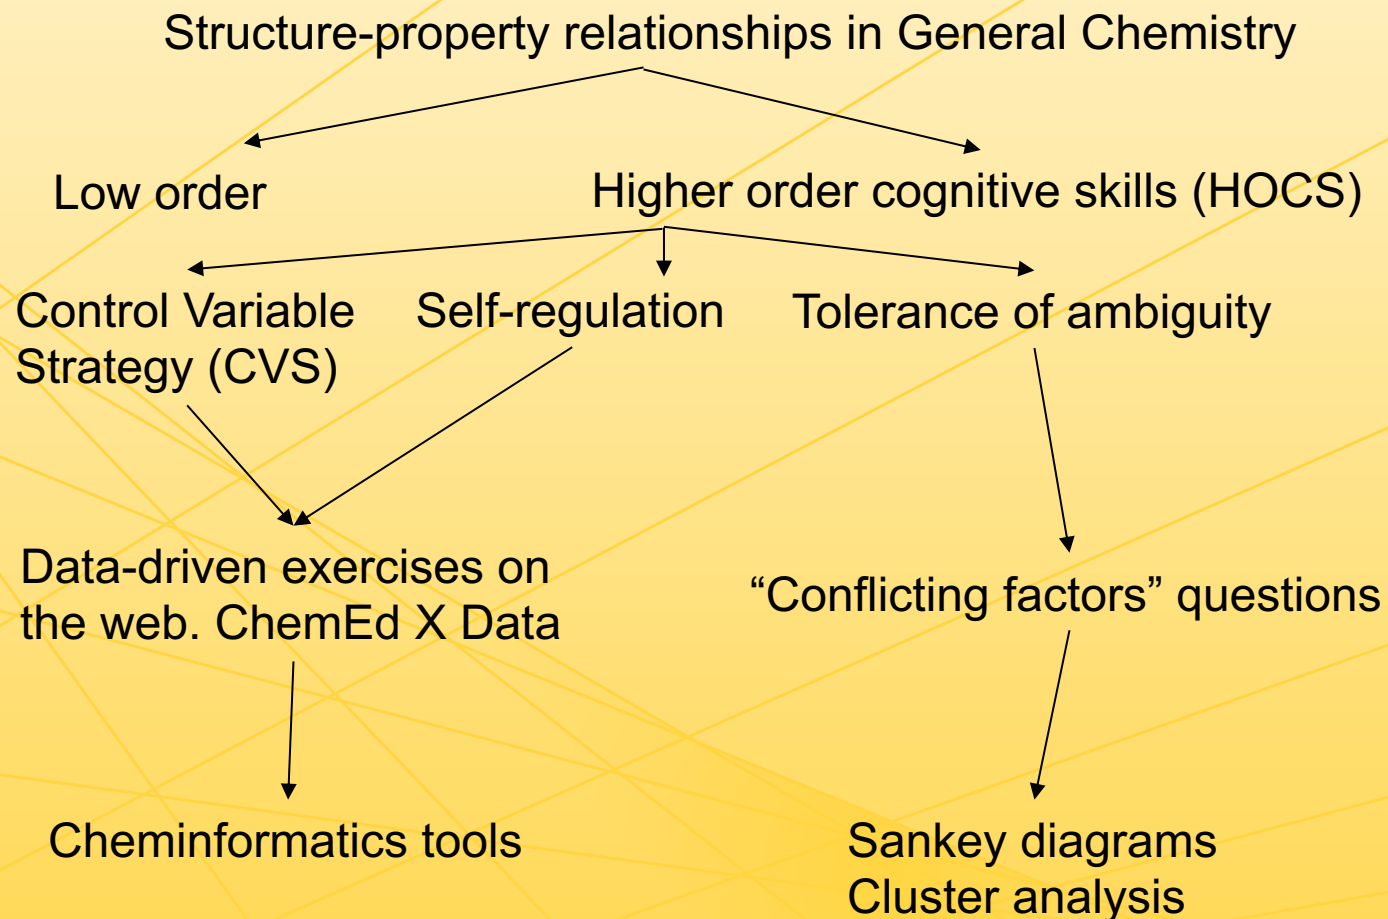

Outline

Curriculum

Objectives

Implementation

Analysis

Structure-property relationships in 1st semester of General Chemistry

Properties of Substance

Substances

Electronic or molecular structure

*(it's never one single factor
... and sometimes they come into conflict)*

Electronic ground state of elements \leftrightarrow Aufbau principle + Hund's rule

Atomic size and ionization energy \leftrightarrow Nuclear charge + shielding + orbital size

Ionic lattice energy of crystal solids \leftrightarrow Cation's and anion's size and charge

Boiling point of molecular solids \leftrightarrow Intermolecular forces + shape + mass

Heat capacity of molecular solids \leftrightarrow Intermolecular forces + bonds + mass

UNIVERSITY OF MINNESOTA

Assignments for HOCS in structure-property relationships: $Y = AX$

- $[Y, A] \rightarrow X$ **Self-regulation**

Given a set of substances (A) and their properties (Y) discover what the deciding structural factors are (X).

- $[Y, A] \overset{?}{\Leftrightarrow} [X]$ **Ambiguity+Conf. factors**

Given a set of factors that may intervene in the property of substances [A], identify the deciding factor that prevails.

- $[A, X] \nrightarrow [Y]$ **Ambiguity+Conf. factors**

Given a set of substances (A) and their structural factors (X), identify the cases when you can't predict (Y).

- $[X, Y] \rightarrow A$ **Self-regulation**

Given that a property (Y) is affected by factors (X), come up with a list of substances (A) that show evidence of the relationship

Higher order skills in Gen. Chem.

Properties of Substance

Substances

Electronic or molecular structure

$$Y \leftrightarrow A X$$

Tolerance of ambiguity: conflicting factors

Example Radius:

Example BP:

Self-regulation: control of variables strategy and interpretation

Using unstructured data, easy to navigate, select and represent to build “controlled experiments” and identify trends and exceptions.

J. Chem. Educ., 91(9), 1501-1504, 2014

UNIVERSITY OF MINNESOTA

Can students do CVS and analysis?

Assignment: Select a set of compounds that help us understand the effect of mass and molecular shape on the boiling point.

| | Effect of mass | | Shape effect: linear/branched | | |
|--|----------------|---------------|-------------------------------|------------------|-------------------|
| | 69.8 % yes | 30.2% no | 40 % yes | 60% no | |
| Builds a valid “controlled experiment” | | | | | |
| Interpretation of data is consistent with selection? | 88% yes | 12 % no | 40% yes | 44% ambiguous | 16% contradict |

Mass: 58.1222; BP=273.

Mass: 58.1222; BP=262.

Mass: 72.14878; BP=309.2

Mass: 72.14878; BP=301.1

Mass: 60.09502; BP=370.3

Mass: 72.10572; BP=336.

Mass: 86.1323; BP=365.

Mass: 100.15888; BP=391.

CVS and identify limit of predictability

| Name | Mass | BP (°C) |
|----------|------|---------|
| Methanol | 32 | 338 |
| Butane | 58 | 273 |
| Octane | 114 | 399 |

<http://chemdata.umn.edu/chemedXdata/index.html#stamp=1470068542409>

Assignment: What has a stronger influence, a heavy molecule with a weak intermolecular force or a light molecule with a strong intermolecular force?
Are there exceptions?

| Mass or IMF? | <u>Mass vs IMF</u> | |
|--|--------------------|-------------|
| | 60.3 % mass | 39.7% no |
| Provide valid evidence of their statement? | 50.8% yes | 49.2% no |

- 39.7% was inconclusive.
- 9% say no exceptions.
- The “new site” effect may add noise to the results

Can students recognize “conflicting factors”?

Final course
grade

Clustering survey results

| | Group B n = 28 | Group C n = 17 | Group A n = 14 |
|--------------------------------------|-------------------|-------------------|-------------------|
| Course Grade | 81.0±9.2 | 79.0±6.2 | 88.0±5.5 |
| Ionic energy survey | 62.7±14.2 | 31.7±9.3 | 88.1±12.9 |
| Conflicting factors questions | 14.3±26.2 | 8.8±19.1 | 85.7±22.6 |

Hierarchical cluster analysis (Ward's minimum variance method)
using the results for the "Ionic lattice energy" survey

Conclusions

- We have used data-driven exercises to address “controlled variable skills” and “self-regulation.”
 - It is challenging to offer students “unstructured data” without a steep learning curve to navigate it.
 - ChemEdXData is now available on GSpreadsheets.
- Identifying conflicting factors and the limit of predictability depends on previous knowledge and it is a HOCS.
 - With a Sankey diagram we can see the progression
 - With clustering analysis we can group the students and see how HOCS relates to their grade
